Award Description The objective is to investigate the role of dredging on fish assemblage stability and persistence on sand bars in the Alabama River. In addition, we will assess diel patterns of habitat use of non-game fishes on sand bars. The role of sand bar size and spatial position will also be investigated. Fishes will be sampled using 100' seines, and samples will be kept separate so that the detectability of each species may be calculated. After identification, most fishes will be released; some vouchers will be taken. These data will provide a baseline for management of the Alabama River aquatic habitats associated with dredging.
