Title: Extension of some log-majorization inequalities to Lie groups

Sima Ahsani

Abstract

log-majorization inequalities of matrices have been studied extensively in matrix theory. In 1973 the concept of log-majorization for matrices was extended to the Lie groups by Bertram Kostant [1]. In fact, Kostant defined a preorder on noncompact semisimple Lie groups. We will look at some recent results on log-majorization inequalities including the geometric mean of two positive definite matrices and show their extension to the context of Lie groups using Kostant preorder.
